

Sample Work: UI Annotation & HTML Structure Analysis Registration

Form UI Analysis & Annotation

ID	Element	Type	HTML Tag	Purpose	Notes
1	Registration Form	Form	<form>	Wraps all inputs	Verified using DevTools
2	Full Name Field	Input Field	<input type="text">	To collect the user's complete name	The input uses a non-standard type="name", which defaults to text behavior in browsers. Using type="text" would improve semantic correctness and code clarity.
3	Email Field	Input Field	<input type="email">	Captures user email address	Uses semantic type="email" for validation; label-input association present; duplicate id="email" observed which may affect accessibility
4	Password Field	Input Field	<input type="password">	Captures user password securely	Uses type="password" to mask input; label association improves accessibility
5	Sign Up Button	Button	<button>	Submits the registration form	Functions as submit button (default type); explicit type="submit" not specified. Styled prominently using

					utility-based CSS, making it visually distinct as the primary action.
6	Divider ("Or continue with")	Separator	<div> + 	Separates form submission from alternative login options	Uses styled border and centered text to visually divide sections
7	GitHub Login Button	Button	<button>	Initiates login via GitHub	Represents an alternative authentication method; combines SVG icon within a button element. Positioned below divider to indicate secondary or alternative action.
8	Avatar Images	Image Group	 (within <div> containers)	Displays user avatars for social proof	Multiple avatar images are arranged in an overlapping layout using utility-based CSS, uses alt attributes for accessibility.

Visual structure: The layout uses a mix of Flexbox and Grid. The outer container uses flex to center everything on the screen, and inside that, a grid splits the page into two sections. The left side mainly focuses on the form, with inputs stacked vertically and spaced nicely. The right side shows avatars and some text.

Improvements:

- Non-standard type="name" used instead of text
- Duplicate id="email" may affect accessibility
- Explicit type="submit" could improve clarity
